LAF0005

ADSL MICROFILTER

PROLINK LAF0005 ADSL Microfilter/Splitter is used to prevent common telephone equipments, such as phones, answering machines, and fax machines from interfering with your ADSL service. If your ADSL enabled phone line is being used with any other equipment other than your ADSL modem, then you will need to use one microfilter for each phone device. Filters may be installed when your ADSL line is installed or when your current phone line is upgraded to ADSL. However, if your telephone line is already split, you will not need to use a microfilter. Each microfilter is connected in-line with your telephone or fax machine so that all signals pass through it. Telephones and / or facsimiles in other rooms that are using the same extension will also required microfilters.
